

Vak: Digital Signal Processing

credits: 5

Vakcode ELVH19ADSP
Naam Digital Signal Processing
Studiejaar 2021-2022
ECTS credits 5
Taal Engels
Coördinator T.W. Scholten

Werkvormen Hoorcollege
 Opdracht
 Practicum / Training
Toetsen Digital Signal Processing - Schriftelijk,
 organisatie ToetsCentrum

Leeruitkomsten

The student can :

- find the real or complex Fourier series representation of a periodic function
- describe the frequency and amplitude characteristics of the different harmonic components of a function;
- calculate and apply Discrete Fourier transform;
- perform calculations with discrete impulse responses, discrete convolution products and frequency responses;
- apply sampling theorem of Shannon, Nyquist frequency and the concept of aliasing;
- identify if a system is stable, linear, causal and/or time invariant;
- calculate and apply the z-transform and know the relation with the Fourier transform;
- conduct stability analysis in the z-plane and in the frequency domain using poles & zeroes and the unit circle;
- calculate the transient behaviour of a discrete system;
- design and classify different forms of digital filters (FIR, IIR notch and low/high pass filters) with given properties and demonstrate this filter;
- calculate the difference equation for filters with given properties.

Inhoud

This study unit consists of tutorials, practicals and theory lectures.

Opgenomen in opleiding(en)

Elektrotechniek Major Sensor Technology
