

Vak: Regeltechniek

credits: 5

Vakcode	ELVH17GREG	Werkvormen	Gastcollege
Naam	Regeltechniek		Practicum / Training
Studiejaar	2022-2023		Werkcollege
ECTS credits	5	Toetsen	Regeltechniek - Schriftelijk, organisatie ToetsCentrum
Taal	Nederlands		
Coördinator	J. Zijlstra		

Leeruitkomsten

The student can:

- develop and analyse 1st and 2nd order system models by means of, or resulting in the corresponding differential equation; and can derive the transfer function of such systems, identifying their characteristic values. In this course we concentrate on mechanical and electrical systems;
- construct system models using block diagrams, and can identify the different forms of transfer functions;
- determine the dynamic response of system components to different inputs and disturbances using the method of Laplace transforms and transfer functions;
- use and apply basic methods for stability and error analysis in order to analyse steady state errors;
- identify the poles and zeros of a dynamic system, and use these methods to analyse the stability behaviour of systems;
- apply basic methods (e.g. proportional-integral-derivative control [PID]) to design feedback systems;
- apply the concepts of frequency response to construct and interpret Bode diagrams;
- calibrate a sensor and determine the transfer function of a sensor controlled process by comparing practical results to theory;
- evaluate control error and control instability in a control system and relate this to theoretical considerations.
